

unit 1

A third and perhaps most popular solution is to use a new cipher, like
#663399

- Advantages: it's easy for humans to encode this cipher from the binary name for a pixel; the ciphertext precisely defines the color, in order RGB; the ciphertext is short
- Disadvantage: the ciphertext has little meaning, it is almost just data

unit 1

Remember that the last three solutions are for people.

The computer is more than happy with 24-bit binary numbers!
