

How do I Teach a Computer to ask for Something?

Input in Python

CSE

Examples:

```
1 input()  
2
```

```
1 int(input())  
2
```

```
1 print('What is your name?')  
2 input()
```

```
1 print('How old are you?')  
2 int(input())
```

Notice that we always use
print to display a prompt
BEFORE the input

unit 2

Fact: 99.9% of the time you will use `print` immediately before `input`.

unit 2

Key Ideas:

- The computer stops following instructions, waiting for the user to type.
- We have to press [enter] to tell the computer to continue.
- Displaying a prompt is important!
